(54) **1,2-Dioxetane derivatives as chemiluscent agents**

(57) A 1,2-dioxetane derivative of formula (I):

wherein R¹, R², R³, R⁴, and R⁵ are each independently a hydrogen atom, an alkyl group, or an aryl group, R² and R³ together and R⁴ and R⁵ together can be joined as a cycloalkyl group, R⁶ is a hydroxyl group, an alkoxy group, an aralkyloxy group, -OSi(R⁸ R⁹ R¹⁰) in which R⁸, R⁹ and R¹⁰ are each independently an alkyl group, or a phosphate salt, and R⁷ is a hydrogen atom, a halogen atom, an alkyl group, or an alkoxy group.

Description**BACKGROUND OF THE INVENTION****Field of the Invention**

The present invention relates to 1,2-dioxetane derivatives which can be used, for instance, as chemiluminescent reagents for immunoassays.

Discussion of Background

Conventionally, varieties of 1,2-dioxetane compounds have been synthesized, in particular, 1,2-dioxetane compounds substituted with a spiroadamantyl group at the 3 position thereof are known to be useful as chemiluminescent substrates, for instance, as disclosed in Japanese Patent Publications 5-21918 and 5-45590.

However, such conventional 1,2-dioxetane compounds cannot be said to be sufficiently thermally stable for use in practice, so that there has been a demand for an improved chemiluminescent compound.

SUMMARY OF THE INVENTION

It is therefore an object of the present invention to provide a chemiluminescent 1,2-dioxetane derivative which is sufficiently thermally stable for use in practice.

This object of the present invention can be achieved by a 1,2-dioxetane derivative of formula (I):

wherein R¹, R², R³, R⁴, and R⁵ are each independently a hydrogen atom, an alkyl group or an aryl group, R² and R³ together and R⁴ and R⁵ together can be joined as a cycloalkyl group, R⁶ is a hydroxyl group, an alkoxy group, an aralkyloxy group, -OSi(R⁸ R⁹ R¹⁰) in which R⁸, R⁹ and R¹⁰ are each independently an alkyl group, or a phosphate salt group, and R⁷ is a hydrogen atom, a halogen atom, an alkyl group or an alkoxy group.

(Step 1)

In this step, an acid chloride of general formula (II) is allowed to react with an alcohol derivative of formula (III) in the presence of an amine such as pyridine or triethyl amine to produce an ester derivative of formula (IV-1):

wherein R^1 to R^5 , R^7 and R^{61} are respectively the same as defined above, and R^{13} is a hydrogen atom or a protective group for hydroxyl group, and when R^{13} is a protective group for hydroxyl group, an alcohol derivative of general formula (IV) is produced after the deprotection is carried out.

(Step 2)

In this step, the alcohol derivative of general formula (IV) is oxidized in a halogenated hydrocarbon solvent such as dichloromethane in the presence of a chromium-based oxidizing agent, such as PCC or PDC, or in a combination of an activator and a solvent, such as $\text{Py} \cdot \text{SO}_3$ /triethylamine/DMSO or Ac_2O /DMSO, whereby a ketone derivative of general formula (V) is produced.

(Step 3)

In this step, the ketone derivative of general formula (V) is reduced to an alcohol derivative of general formula (VI), using a reducing agent and a base, in the presence of titanium. In this reaction, the use of titanium is indispensable. As a source for titanium, titanium halide such as titanium chloride is employed.

In the above reduction reaction, it is preferable that as the reducing agent, for example, lithium aluminum halide be employed, and as the base, for example, triethylamine or pyridine be employed to produce a reduction state.

It is preferable that the reaction be carried out in an ether such as tetrahydrofuran. The reaction proceeds at temperatures of 0 to 100°C, but in view of the reaction operation and the reactivity of the reaction mixture, it is preferable that the reaction be carried out with the reaction mixture being refluxed in THF.

(Step 4)

In this step, the alcohol derivative of general formula (VI) is subjected to dehydrative cyclization in the presence of a catalyst, whereby a dihydrofuran derivative of general formula (VII) is produced. It is preferable that, for example, PPTS or p-toluenesulfonic acid be employed as the catalyst. As a solvent for the above reaction, for example, an aromatic hydrocarbon such as benzene, toluene or xylene, can be employed.

(Step 5)

In this step, the dihydrofuran derivative of general formula (VII) is subjected to a deprotection reaction, whereby a phenol derivative of general formula (VIII) is produced.

The compound subjected to the deprotection reaction is the above-mentioned dihydrofuran derivative of general formula (VII), in which R¹ to R⁵ are the same as defined above, and R⁶¹ is a protective group for hydroxyl group, which is preferably methoxy group, or benzyloxy group.

This deprotection reaction is conventionally well known to those skilled in this art, which may be carried out either by reacting therewith an anion of an alkylthiol, or by carrying out the hydration thereof, which may be appropriately selected dependent upon the group to be deprotected.

(Step 6)

In this step, for the formation of silyloxy group or phosphoric group, a halogenated trialkyl silane or a halogenated phosphate respectively corresponding thereto is allowed to react with the above-mentioned alcohol derivative of general formula (VIII), whereby a compound of general formula (IX) is produced:

wherein R¹ to R⁵, and R⁷ are the same as defined above, and R⁶² is -OSi(R⁸ R⁹ R¹⁰) in which R⁸ to R¹⁰ are the same as defined above, or

wherein R¹¹ and R¹² are each independently an alkyl group, or R¹¹ and R¹² together can be joined to form a ring.

In this step, when chloroethylene phosphate is reacted for the introduction of the phosphoric group, the chloroethylene is converted into a sodium salt of cyanoethylphosphate by use of sodium cyanide, followed by the elimination of a cyanoethyl group, and then converted into an ammonium sodium salt. The ammonium sodium salt can be easily converted into a disodium salt by reacting with sodium hydrogencarbonate.

(Step 7)

In this step, the dihydrofuran derivative of general formula (VII), general formula (VIII) or general formula (IX) is allowed to react with singlet oxygen, whereby the above-mentioned 1,2-dioxetane derivative of general formula (I) is produced.

The reaction of the dihydrofuran derivative of general formula (VII), general formula (VIII) or general formula (IX) with singlet oxygen can be carried out by dissolving the dihydrofuran derivative in a solvent, for example, a halogenated hydrocarbon such as dichloromethane, dichloroethane or carbon tetrachloride, or an alcohol such as methanol or ethanol, and irradiating the solution to visible light in the presence of a photosensitizer such as Methylene Blue, Rose

Bengale or tetraphenylporphine in an atmosphere of oxygen. This reaction is carried out at -80°C to room temperature. The 1,2-dioxetane derivative of formula (I) may be a 1,2-dioxetane derivative of the following formula (Ia):

wherein R^1 , R^2 , R^3 , R^4 , and R^5 are each independently a hydrogen atom, an alkyl group, or an aryl group, R^2 and R^3 together and R^4 and R^5 together can be joined as a cycloalkyl group, R^6 is a hydroxyl group, an alkoxy group, an aralkyloxy group, $-\text{OSi}(R^8 R^9 R^{10})$ in which R^8 , R^9 and R^{10} are each independently an alkyl group, or a phosphate salt, and R^7 is a hydrogen atom, a halogen atom, an alkyl group, or an alkoxy group, as defined in the above-mentioned formula (I).

In the above 1,2-dioxetane derivative of formula (Ia), R^1 , R^2 and R^3 may be each independently an alkyl group, R^4 may be an aryl group, R^5 may be a hydrogen atom, R^6 may be a hydroxyl group, an alkoxy group, an aralkyloxy group, $-\text{OSi}(R^8 R^9 R^{10})$ in which R^8 , R^9 and R^{10} are each independently an alkyl group, or a phosphate salt, and R^7 may be a hydrogen atom.

In the above-mentioned 1,2-dioxetane derivative, R^1 , R^2 and R^3 may be each independently an alkyl group having 1 to 4 carbon atoms, R^4 may be a phenyl group, R^5 may be a hydrogen atom, R^6 may be a hydroxyl group, an alkoxy group which may be, for example, an alkoxy group having 1 to 4 carbon atoms, $-\text{OSi}(R^8 R^9 R^{10})$ in which R^8 , R^9 and R^{10} are each independently an alkyl group which may be, for example, an alkyl group having 1 to 4 carbon atoms, or a phosphate salt, and R^7 is a hydrogen atom.

Furthermore, in the 1,2-dioxetane derivative of formula (Ia), R^1 , R^2 , R^3 and R^4 may be each independently an alkyl group, R^5 is a hydrogen atom, R^6 is a hydroxyl group, an alkoxy group, an aralkyloxy group, $-\text{OSi}(R^8 R^9 R^{10})$ in which R^8 , R^9 and R^{10} are each independently an alkyl group, or a phosphate salt, and R^7 is a hydrogen atom.

In the above-mentioned 1,2-dioxetane derivative, R^1 , R^2 , R^3 and R^4 may be each independently an alkyl group having 1 to 4 carbon atoms, R^5 may be a hydrogen atom, R^6 may be a hydroxyl group, an alkoxy group which may be, for example, an alkoxy group having 1 to 4 carbon atoms, an aralkyloxy group, $-\text{OSi}(R^8 R^9 R^{10})$ in which R^8 , R^9 and R^{10} are each independently an alkyl group which may be, for example, an alkyl group having 1 to 4 carbon atoms, or a phosphate salt, and R^7 may be a hydrogen atom.

Other features of this invention will become apparent in the course of the following description of exemplary embodiments, which are given for illustration of the invention and are not intended to be limiting thereof.

1 ml of a 1.00×10^{-5} M DMSO solution of 5-*t*-butyl-1-[3-(*t*-butyldimethylsiloxy)phenyl]-4,4-dimethyl-3-phenyl-2,6,7-trioxabicyclo[3.2.0]heptane (Compound [47]) synthesized in Example 12 was added to 2 ml of 1.0×10^{-2} M DMSO of tetrabutylammoniumfluoride at 25°C.

The luminescence of the mixture at that moment was measured by a fluorescence analyzer. The luminescent quantum efficiency at that moment was estimated to be 0.13, and the half-life of the luminescence was 165 seconds and λ_{max} was 458 nm.

Thus, the 1,2-dioxetane derivatives of general formula (I) of the present invention have extremely high thermal stability and therefore when preserving the same, no refrigeration is necessary, and there are no troubles with respect to, for instance, time adjustment and temperature control.
